1 Inputs

Message	`abhishek`
Data bits	`01100001011000100110100001101001011100110110100001100101011010 11` (64 bits)
Generator	`1011` (4 bits)
Appended zeros	3

2 Sender: polynomial long division

Augmented dividend (data + 3 zeros):

`01100001011000100110100001101001011100110110100001100101011010 11000`

Generator: `1011`. At each step a leading 1 is cancelled by XOR with the generator ($\oplus$ marks such a step):

step	xor	register after step
0	—	01100001011000100110100001101001011100110110100001100101011010111000

63	—	00000000000000000000000000000000100

3 Transmitted frame

CRC remainder: `100`. Frame = data + CRC:

`01100001011000100110100001101001011100110110100001100101011010111100` (67 bits)

4 Receiver verification

Received frame: `01100001011000100110100001101001011100110110100001100101011010111100`. Flipped bit positions: none. Dividing by `1011` gives remainder `000`.

VALID — no error

Remainder is all zero, so the frame arrived intact.
